FIXED SNAPSHOT — NOT LIVE

All numbers below are from **Jul 31, 2026 · 18:52 ET**. Prices and engine data may have changed since this snapshot. This sheet describes conditions at one moment — it is not a forecast.

[Open live NVDA chart →](#)

How to read: This is a fixed snapshot — not a live feed. The sections below explain what the engine showed at one moment. The chart and tables give the same read in numbers. **Always confirm on the live chart before acting.**

THE READ

At this snapshot, the daily bar sat in Full Storm (weekly: Tailwind). On the daily bar, ADX was 15.0 (below 25 · not confirmed) while DI- led DI+ (17.6 / 21.9) and Hurst sat near 0.46 (random walk). Price was below the 50-day and above the 100-day/200-day. Put together: sellers had the daily wheel, and trend strength had not locked in (ADX below 20). MACD and the histogram lined up with that same side — control and momentum were telling one story. RSI sat in a more neutral band — less of a stretch story, more of a control-and-momentum story. Hurst sat near random walk — persistence was not a strong vote either way. This describes conditions at the snapshot — not a forecast of direction.

Weather by timeframe: 15M Tailwind · 1H Thin Ice · 4H Full Storm · 1D Full Storm · 1W Tailwind

TECHNICALS

- Levels: R1 at \$208.75 — first resistance above snapshot price (Swing).
- Levels: A sustained move above R1 could bring R2 at \$210.43 – 211.91 into focus; a failure could see price retreat toward S1 at \$192.68 and S2 at \$189.80 – 191.22 if S1 fails.
- Levels: Monitor participation on any test of R1 or S1 — thin moves are less convincing than volume-backed acceptance.
- MAs: Spot vs 50/100/200 — \$206.17 (Below -2.6%), \$200.45 (Above +0.2%), \$193.11 (Above +4.0%).
- Momentum: Adaptive RSI in Range / revert (current) mode — OB/OS at 70/30; RSI 48.3 reads neutral · 30 band. MACD Below signal; Bear narrowing.

THE BOTTOM LINE

- Full Storm daily backdrop — weekly read Tailwind. Sellers led the daily bar; momentum agreed.

- With sellers and momentum aligned, the map question is whether S1 near \$192.68 absorbs the pressure — or whether any bounce has to clear R1 near \$208.75 before the story changes.
- Stretch check: RSI 48.3 (neutral · 30 band). Price was below the 50-day and above the 100-day/200-day.
- Open the live NVDA chart for current reads — this sheet is a fixed snapshot (engine bar date 2026-07-31).

PRICE MAP — WHAT TO WATCH ON THE CHART

Daily candles to the snapshot date. Chart overlays the nearest 3 supports and 3 resistances; the S/R section below lists up to 4 per side. Top strip lists those chart levels; Y-axis shows short tags only (R1, S1, $\pm\sigma$). Blue line = snapshot price.

NVDA · DAILY · SNAPSHOT 2026-07-31 Level values in top strip · axis tags only (R1, S1, $\pm\sigma$)

SMA 50 — 206.17	R1 — 208.75	S1 — 192.68	+1 σ — 205.56	-1 σ — 196.35
SMA 100 — 200.45	R2 — 210.43 — 211.91	S2 — 189.80 — 191.22	+2 σ — 210.32	-2 σ — 191.90
SMA 200 — 193.11	R3 — 212.50 — 213.99	S3 — 173.66	+3 σ — 215.19	-3 σ — 187.56

DAILY Σ PRICE BAND

Typical one-day up/down range from 252 days of daily log returns — same formula as the live app.

-3 σ	-2 σ	-1 σ	SPOT	+1 σ	+2 σ	+3 σ
\$187.56	\$191.90	\$196.35	\$200.75	\$205.56	\$210.32	\$215.19
-6.6%	-4.4%	-2.2%	-	+2.4%	+4.8%	+7.2%

252-day historical daily vol at snapshot: $1\sigma \approx 2.29\%$ ($\pm \$4.81$ on this close). 252 trading days of daily log returns $\rightarrow \mu$ and $\sigma \rightarrow \text{spot} \times \exp(\mu \pm k\sigma)$. Same engine formula as Call for Action. Historical close-to-close vol — not ATR or options implied vol.

SUPPORT & RESISTANCE

Prices where the move has paused before. Resistance sits above price; support sits below.

REGIME — ALL TIMEFRAMES

The market “weather” on each timeframe — calm, expansion, fragile, or stressed. Timeframes can disagree.

15M Tailwind EXPANSION	1H Thin Ice FRAGILE	4H Full Storm CRISIS	1D Full Storm CRISIS	1W Tailwind EXPANSION
-------------------------------------	----------------------------------	-----------------------------------	-----------------------------------	------------------------------------

TREND & CONTROL

Whether a real trend exists, and who is in control (buyers or sellers), on each timeframe.

15M random walk ADX 28.7 · bull DI	1H random walk ADX 27.1 · bull DI	4H trend emerging ADX 23.7 · bear DI	1D no trend ADX 15.0 · bear DI	1W mean reverting ADX 25.3 · bull DI
--	---	--	--	--

TREND PERSISTENCE (1D)

Whether the daily move is likely to continue (trend) or fade (mean-revert), and which side is in control.

SIGNAL	VALUE	READ
Hurst	0.46	Random walk
DI+ / DI-	17.6 / 21.9	DI- higher (daily bar)
ADX	15.0	Below 25 · not confirmed

MOMENTUM (1D)

Short-term speed of the move. RSI flags stretched conditions; MACD shows momentum building or fading.

SIGNAL	VALUE	READ
RSI(14)	48.3	neutral · 30 band
MACD	-1.96	Below signal
Signal / Hist	-0.99 / -0.96	Bear narrowing

MOVING AVERAGES (1D)

Where price sits versus its 50-, 100-, and 200-day averages. Above = longer-term strength; below = weakness.

MA	PRICE	VS SPOT
SMA 50	206.17	Below -2.6%
SMA 100	200.45	Above +0.2%
SMA 200	193.11	Above +4.0%

1D is in range with bearish DI, so the engine uses the 30 / 70 band (not the fixed 70/30). RSI 48.3 sits in neutral → reads as neutral. Same adaptive logic as the live Call-for-Action tab.

MARKET REGIME EXPLAINED

Each timeframe is assigned exactly one market regime. The engine ranks today's Composite Stress Score (CSS) against that rolling history and expresses the result as a 0–100th percentile stress rank. CSS blends volatility, drawdown, momentum stress, and related inputs into one score — it measures market stress, not price direction. The rank uses a rolling history of past CSS values on that same timeframe and asset. Window length is calibrated per timeframe and asset class — roughly three years of history at the long horizon (W1): about 756 daily bars for US equities and large-cap stocks, about 1,095 daily bars for crypto on 1D, and proportionally longer windows on intraday bars. The labels below translate those percentile rankings into plain-English market states. The All Timeframes summary above shows the regime currently assigned to each timeframe.

Important: A regime describes the current market environment — not whether price is bullish or bearish. An asset can rally or decline in any regime. The label reflects the level of market stress relative to that asset's own history, not the expected direction of the next move.

Regimes are relative to each asset's own historical behavior. Clear Skies for Bitcoin does not imply the same level of absolute volatility as Clear Skies for Treasury bonds or large-cap equities.

To reduce unnecessary regime changes, all labels require persistence before transitioning. Higher-stress regimes generally require stronger confirmation before clearing.

Regime	Stress rank	Meaning
Clear Skies	Lowest ~30%	Quiet conditions
Tailwind	30–50%	Orderly market
Thin Ice	50–70%	Stress building
Storm Warning	70–90%	Elevated stress
Full Storm	Top ~10%	Extreme stress

Clear Skies CALM — Low stress relative to this asset's history

In practice: Volatility is unusually quiet for this asset on this timeframe. Price action is generally smoother, daily swings tend to be smaller, and volatility shocks occur less frequently. Strong trends can still develop, but the market environment is not being dominated by elevated stress.

Engine rule: CSS ranks below approximately the 30th percentile — current stress is lower than roughly 70% of recent observations for this asset and timeframe.

Tailwind EXPANSION — Moderate stress with orderly market conditions

In practice: Volatility is present but remains generally supportive of orderly price discovery. Trends often extend without the instability seen in higher-stress environments, while pullbacks are less likely to become disorderly. Market conditions remain constructive, although direction should always be confirmed using other indicators.

Engine rule: CSS ranks between approximately the 30th and 50th percentiles — lower-to-middle historical stress for this asset on this timeframe.

Thin Ice FRAGILE — Stress building, market structure becoming less stable

In practice: The ground is beginning to crack. Volatility is increasing, market conditions become less stable, and reversals become more common. Breakouts may become less reliable as uncertainty builds, requiring greater selectivity and risk awareness.

Engine rule: CSS ranks between approximately the 50th and 70th percentiles — upper-middle historical stress. Early-warning zone where stress is becoming meaningful but has not yet reached extreme levels.

Storm Warning STRESS — High stress with elevated market risk

In practice: Market stress has become elevated. Price swings widen, gap risk increases, and technical behavior becomes less predictable. Traditional chart patterns and technical setups often become less dependable until stress begins to subside.

Engine rule: CSS ranks between approximately the 70th and 90th percentiles — within the highest 20% of historical stress for this asset and timeframe.

Full Storm CRISIS — Extreme stress or crash conditions

In practice: The market is experiencing exceptionally high stress. Large price swings, heightened gap risk, and sharp increases in volatility can dominate price behavior. Correlations may shift unexpectedly, and many traditional technical reference points become less reliable while stress remains elevated.

Engine rule: CSS ranks above the 90th percentile (not including 90 itself), or an immediate crash override is triggered by severe drawdown or volatility-spike rules within the engine.
